1: Introduction

1.1 Background

Marketing and its techniques are constantly evolving, and research suggests that marketing theory must adapt to new concepts, logic, and tools in line with ongoing changes in the world (Pascucci et al., 2023). In the past, brands focused on promoting their products using techniques such as humour or by highlighting functional attributes to show how the product could solve a problem or cater to a need.

However, marketing has now shifted towards purpose-driven marketing. This refers to the use of marketing and advertising to support a company's social, environmental, or ethical goals, rather than only promoting products (Mueller, 2025). As a result, marketing is no longer just about selling their products, but also about associating the brand with a social cause and through this building long-term relationships with consumers.

1.2 Importance of the Research

Purpose-driven marketing has become increasingly essential, especially when targeting Millennials and Generation Z. Research shows that purpose-driven branding, such as Patagonia's climate activism and Ben & Jerry's social justice initiatives, can build strong loyalty among younger consumers (Shivhare, 2025).

In addition, many businesses have started to change, or claim to change, their as it is highly demanded by consumers. For example, research suggests that companies are expected to become more environmentally friendly in response to increased demand for sustainable products (Machová et al., 2022).

However, not all purpose-driven marketing is perceived as authentic. Some brands claim to support social causes, but their actions do not match with their messaging, making their efforts appear performative. This misalignment can create suspicion and

lead consumers to question the brand's intentions and values (Aisy, Iqbal, and Rahimah, 2025). Therefore to build trust and develop strong, long-term relationships with consumers, purpose-driven marketing must be perceived as authentic.

1.3 The Problem of Authenticity in Purpose-Driven Marketing

Purpose-driven marketing is often seen as beneficial; however, a key problem lies in how authentic these advertisements are perceived to be. Some brands focus on profit maximization and use purpose-driven marketing as a strategic tool rather than a genuine commitment to a social cause. A clear example of this issue is greenwashing. For instance, Greenpeace criticized Nestlé for unsustainable palm oil procurement despite its claims of environmental responsibility. Similarly, Coca-Cola faced backlash over plastic pollution despite promoting sustainable goals (Álvarez-García and Sureda-Negre, 2023).

This makes consumers confused, making it difficult to distinguish between authentic and performative marketing. As a result, consumers may become more skeptical and begin to question the true intentions behind brand campaigns, even when they appear genuine.

This is a critical concern because when consumers perceive marketing efforts as inauthentic, it can decrease trust and weaken the brand consumer relationship. Instead of building positive connections, performative campaigns may lead to negative reactions, including resentment or even rejecting the brand. In such cases, brands risk losing both existing and potential customers.

Furthermore, when brands communicate one set of values but act differently, they lose credibility. This inconsistency leads to a decrease in trust and more negative perceptions of the brand. It highlights the importance of aligning brand messaging with actions, as sudden shifts in communication can increase consumer skepticism and further decrease trust (Lou et al., 2024).

1.4 Aim of the research: -

This research aims to examine how purpose-driven marketing influences consumer trust, keeping perceived authenticity in mind. This research also wants to understand how consumers interpret authentic and performative marketing efforts.

1.5 Research Questions: -

RQ1: Does purpose-driven marketing have a positive impact on consumer trust?

RQ2: How does perceived authenticity moderate the relationship between the type of purpose-driven marketing and consumer trust?

2 Literature Review:**2.1 Evolution of Marketing:**

Marketing has changed over time. Earlier, brands focused on selling their products. Now, they focus more on their purpose. In recent years, many brands have started engaging with social issues. For example, Dove has challenged beauty standards in Asian markets. Similarly, Glow & Lovely changed its name and advertising after criticism of its earlier messaging.

This shift is known as purpose-driven marketing. It refers to brands aligning their values with a social cause and making it part of who they are, in other words their identity. By doing this, brands aim to build stronger emotional connections with consumers and add meaning to their products (Fernandes et al., 2024).

Although purpose-driven marketing is becoming more crucial, research does not always question whether it is truly authentic. Many studies assume that brands act honestly, but they do not always examine whether these efforts are originated from genuine values or strategic decisions. As a result, there is still confusion between what is authentic and what is simply marketing, leaving consumer interpretations unclear

(Vredenburg et al., 2020a). This raises the question of how authenticity influences trust in practice.

2.2 Impact on Consumer Trust

Purpose-driven marketing strongly influences consumers, especially Millennials and Generation Z. Research shows that these groups are more likely to support brands that act responsibly and contribute something positive to society (Ogunode, Ogah, and Adejimi, 2025).

A strong example is the Dove Stop the Beauty Test campaign. It challenges beauty standards in Indian society and uses everyday women instead of idealized models. This makes the campaign more relatable and credible, thereby increasing consumer trust (Mittal, 2025).

Nevertheless, authenticity is often assumed rather than treated as a key factor. While many studies show that purpose-driven marketing builds trust, they do not always consider that consumers may view these efforts as inconsistent or dishonest. This is important because skepticism can reduce trust, affect attitudes, and lower consumers' willingness to support CSR efforts (Ramasamy et al., 2020).

2.3 Emotional Connection with Consumers

Emotional branding suggests that brands can build strong relationships by connecting with consumers on an emotional level. When brands like Nike or Samsung use this approach, consumers often feel part of something bigger. This strengthens their connection with the brand and can influence their buying decisions.

For example, Apple's Product (RED) campaign supports AIDS research. Consumers are encouraged to buy products not only for their use but also for their social impact. This shows how emotional and functional value can work together to influence behaviour (Ferraris et al., 2019).

This can also be explained using Self-Identity Theory. People tend to choose brands that align with their values and self-perception (Pai et al., 2025). For example, Nike users often associate themselves with motivation and strength, which comes from the brand's messaging. When a brand aligns with a person's identity, it creates a stronger emotional bond and influences purchasing behaviour (Xi et al., 2022).

At the same time, emotional connection can also create challenges. Research often focuses on the positive side but pays less attention to the risks when authenticity is missing. When brands build emotional connections, consumers expect them to act according to their stated values. Today, consumers expect brands to take a stand on social issues, but they are also skeptical about whether these efforts are genuine (Kubiak and Ouda, 2020).

If emotional messages are seen as fake or forced, they can decrease trust and lead to negative reactions, such as anti-brand behaviour.

Thus, emotional and self-identity mechanisms only build lasting trust when perceived authenticity is high.

2.4 Consumer Skepticism towards Purpose-Driven Marketing

Although purpose-driven marketing is often viewed positively, consumer responses are not always favourable. Some campaigns are seen as inauthentic, ineffective, or even offensive. Research shows that consumers are becoming better at distinguishing between genuine and performative marketing, often referred to as purpose-washing (Virkus and Klein, 2025).

One reason for this skepticism is the relevance of the cause. For example, Dove is seen as authentic because its campaigns align with its focus on beauty. In contrast, Pepsi's Live for Now campaign was criticized for failing to align with the issue it wanted

to address. The use of a celebrity with no clear connection to the cause also reduced its credibility (Dunnam and Louisiana State University, 2022).

Another crucial factor is consistency. Consumers expect brands to act in line with their values over time. Sudden changes in messaging can create doubt and lead consumers to question a brand's intentions. Research shows that when brand actions do not match their communication, consumers are more likely to become skeptical (Virkus and Klein, 2025).

This can be explained using Spence's (1973) signalling theory. When consumers are uncertain, they rely on signals to judge whether a brand is trustworthy. Strong signals come from consistent, meaningful actions, whereas weak signals come from surface-level messaging (Bafera, Kleinert, and The Author(s), 2023).

Beyond these general patterns of skepticism, research also suggests that consumers actively evaluate specific signals when judging whether purpose-driven marketing is authentic.

Consumers judge perceived authenticity in purpose-driven marketing. One important factor is cause–brand fit, which refers to whether the social cause aligns with the brand's identity. Another factor is consistency, as consumers evaluate whether the brand's messaging remains stable over time and whether its actions match what it communicates. For example, Nike has publicly advocated against child labour but has also been accused of using child labour within its supply chain. Research highlights that public backlash emerged following its involvement in international sweatshops, particularly those exploiting women and children (Oviedo, 2022). Such contradictions can significantly damage perceived authenticity. A third determinant is the motivation behind the campaign, in which consumers distinguish between intrinsic intentions and purely strategic actions. For example, Dove's "Stop the Beauty Test" campaign is perceived as authentic due to its long-standing commitment and consistency in

messaging. In contrast, Pepsi's "Live for Now" campaign and Glow & Lovely's rebranding have been criticized for weak relevance and inconsistency, leading to perceptions of performative marketing (Dunnam and Louisiana State University, 2022). This distinction can be explained by Spence's (1973) signalling theory, which suggests that strong signals, such as consistent actions and relevant messaging, reduce skepticism, whereas weak or mismatched signals increase consumer doubt. This shows that consumers evaluate authenticity through verifiable signals.

Purpose-driven marketing has gained significant attention, but research remains underdeveloped. Many studies focus on brand activism and its effects, but fewer examine how consumers evaluate authenticity and how this influences trust (Vredenburg et al., 2020).

2.5 Literature Gap:

Area of Research	What Existing Literature Focuses on	Identified Gap	How this study addresses this gap
Purpose Driven Marketing & Brand Activism	Emphasis on brand activism and its general effects on consumers.	Limited focus on how consumers evaluate authenticity and its impact on trust.	Examines how perceived authenticity influences consumer trust
Emotional Connection & Self-Identity	Focus on emotional engagement and identity alignment with brands.	Insufficient exploration of how these factors shape consumer trust in purpose-driven marketing.	Investigates the role of emotional connection and self-identity in building trust
Consistency in Brand <u>Behaviour</u>	Recognition of brand values and communication strategies.	Limited attention to alignment between values, communication <u>and</u> action over time.	Explores how consistency influences perceptions of authenticity and trust
Consumer Evaluation of Authenticity	General discussion of authenticity in marketing.	Lack of understanding of how consumers assess key authenticity determinants.	Analyses how consumers interpret authenticity cues in advertisements.
Methodological Approach	Predominantly conceptual or survey-based studies.	Limited experimental research on purpose-driven marketing and trust.	Uses a controlled experiment with real advertisements.
Moderating Role of Authenticity	Assumes authenticity as given or implicit.	Limited examination of authenticity as a moderating variable.	Tests perceived authenticity as a moderator between purpose-driven marketing and consumer trust.

2.6 Theoretical Framework

Purpose-driven marketing is a strategy in which brands align their values with a social cause to build awareness and strengthen relationships with consumers (Fernandes et al., 2024). Today, brands are expected to move beyond profit and contribute meaningfully to society (Iglesias and Ind, 2020).

In this study, consumer trust is the dependent variable, while the type of purpose-driven marketing (authentic vs performative) is the independent variable. Different types of marketing are expected to create different consumer responses, which then influence trust. Consumer trust is important because it supports long-term relationships between brands and customers (Chaudhuri and Holbrook, 2001).

This study uses Spence's signalling theory (1973) to explain how consumers interpret purpose-driven marketing. Consumers often do not fully understand a brand's intentions, especially when social issues are involved. As a result, they rely on signals to make judgments.

Authentic marketing sends stronger signals because it shows consistency between values, actions, and communication. In contrast, performative marketing sends weaker signals, as it may appear opportunistic. However, how these signals are interpreted depends on the consumer

2.7 Tick Table:

Author (Year)	Purpose-Driven Marketing	Consumer Trust	Perceived Authenticity	Consumer Skepticism	Experimental Design
Fernandes et al. (2024)	✓				
Chaudhuri & Holbrook (2001)		✓

Spence (1973)			✓		
Dunnam (2022)	✓		✓	✓	
Kubiak & Ouda (2020)	✓	✓	✓		
This Study	✓	✓	✓	✓	✓

2.8 Conceptual Framework: -

2.9 Hypothesis: -

H1: Participants exposed to the authentic purpose-driven advertisement will report significantly higher levels of consumer trust than those exposed to the performative purpose-driven advertisement.

By focusing on social and environmental issues, brands can build trust and strengthen their relationship with consumers (Pardo-Jaramillo et al., 2025). The literature may overestimate the effectiveness of purpose-driven marketing while overlooking differences in consumer responses when authenticity is called into question. Therefore, consumer trust depends not only on the message itself but also on how authentic that message is perceived to be.

H2: Perceived authenticity moderates the relationship between purpose-driven marketing and consumer trust, such that the positive effect of authentic purpose-driven marketing on consumer trust is stronger when perceived authenticity is high.

Perceived authenticity acts as a moderating variable; when marketing is seen as authentic, it increases trust, and when it is seen as performative, trust decreases. Therefore, the effect of purpose-driven marketing on consumer trust is expected to vary depending on how authentic consumers perceive the marketing to be.

3 Methodology

This section outlines the research method used to examine how purpose-driven marketing influences consumer trust. Since this study focuses on testing relationships between variables, a quantitative approach is used. This approach allows data to be collected in a structured and measurable way, making it easier to analyse patterns and relationships between variables. A quantitative method is appropriate for this study because it enables clear comparison between different groups and helps in identifying differences in responses.

An experimental design is adopted in this study because it allows for a controlled comparison of different types of purpose-driven marketing. Experimental research is useful because it allows the researcher to manipulate one variable and observe its effect on another under controlled conditions. In this case, the type of purpose-driven marketing is manipulated to examine its effect on consumer trust. This design helps establish cause-and-effect relationships, making it easier to understand how different types of marketing influence consumer perceptions.

Participants are divided into two groups, Group A and Group B. Each group is exposed to a different advertisement. One advertisement represents authentic purpose-driven marketing, while the other represents performative purpose-driven marketing. The advertisement is shown before participants complete the questionnaire. Each participant is exposed to only one advertisement, ensuring that their responses are based on a single condition. This helps reduce bias and ensures that any differences in responses can be linked to the type of advertisement shown rather than other external factors.

The advertisement selected is from the Dove campaign “Stop the Beauty Test,” as it reflects the brand’s core values and has been widely recognized as authentic. In contrast, the performative advertisement is selected from Glow & Lovely, which has received criticism for inconsistencies between its messaging and past brand positioning. The use of these two advertisements allows for a clear distinction between authentic and performative purpose-driven marketing, which is necessary for assessing the proposed hypotheses. After viewing the advertisement, participants are required to complete a questionnaire.

3.1 Data Collection and Sampling

Data is collected via an online questionnaire administered through Qualtrics. This platform is selected because it enables structured, consistent data collection. It also

ensures that all participants receive the same set of questions in the same format, which improves reliability. In addition, online surveys make it easier to collect responses efficiently and reduce the chances of data entry errors.

Participants are recruited using a convenience sampling method. This means participants are selected based on ease of access rather than random selection from a wider population. The study focuses on Millennials and Generation Z, as these groups are more likely to engage with purpose-driven marketing and are more aware of social and ethical issues. This makes them relevant for this research.

The sample size for this study is 100 participants. This number is considered appropriate for comparing responses between the two groups. Participants are randomly assigned to either Group A or Group B. Random assignment is important because it helps reduce bias and ensures that both groups are similar.

3.2 Measurement and Scales

The questionnaire is designed to measure the key variables in this study: perceived authenticity and consumer trust.

Perceived authenticity is measured through questions that assess whether the advertisement aligns with the brand's values, whether it is consistent with previous messaging, and whether it appears genuine. These questions help capture how participants interpret the credibility of the advertisement.

Consumer trust is measured by asking participants about their level of trust in the brand and how the advertisement influences their perception. Trust is an important outcome in this study, as it reflects how effective purpose-driven marketing is in building consumer relationships.

The questionnaire consists of 14 items, each measured on a five-point Likert scale. The scale ranges from 1 (Not at all) to 5 (To a very great extent). This type of scale is

used because it is simple, easy to understand, and allows participants to express different levels of agreement. It also makes it easier to compare responses and perform statistical analysis.

3.3 Procedure

Participants are first provided with a consent form. This form explains the purpose of the study and ensures that participation is voluntary. It also informs participants of their rights, including the option to withdraw at any time. This step is important to ensure that ethical standards are followed.

After providing consent, participants are randomly assigned to one of the two groups. Each participant is then shown one advertisement based on their assigned group. This ensures that participants are only exposed to one type of purpose-driven marketing, which helps maintain the validity of the experiment.

Once the advertisement has been shown, participants are asked to complete the questionnaire immediately. This helps capture their immediate reactions and reduces the chances of forgetting crucial details. Collecting responses immediately after exposure improves data accuracy.

The questionnaire begins with questions related to the advertisement and ends with demographic questions. This order is used to prevent demographic factors from influencing participants' initial responses. Focusing on the advertisement first helps ensure more genuine and unbiased answers.

3.4 Data Analysis

The collected data will be analysed using statistical methods to test the hypotheses and examine the relationships between variables. In this study, the independent variable is the type of purpose-driven marketing, the dependent variable is consumer trust, and perceived authenticity acts as the moderating variable.

To test H1, an independent samples t-test will be conducted. This test will compare the mean level of consumer trust between the two groups. It will help determine whether there is a statistically significant difference based on the type of advertisement shown.

To test H2, a regression-based moderation analysis will be used. This analysis will examine whether perceived authenticity influences the relationship between purpose-driven marketing and consumer trust. It will help determine whether the effect of marketing on trust varies with how authentic the advertisement is perceived to be.

3.5 Proposed Research Timetable: -

April	Development and finalization of survey questions and experimental design
May	Submission for ethical approval and review by the ethics committee
June	Data collection through experiment and questionnaire distribution
July	Data analysis and initial writing of findings and discussion
August	Final writing, editing, and submission of the research project

3.6 Limitations

This study has one main limitation. Only one advertisement is used for each condition, which may not fully represent all types of purpose-driven marketing. In addition, convenience sampling is used, which may limit the extent to which the results can be applied to a wider population. These factors may affect the generalisability of the findings. Another limitation of this research is that the participant might have a bias towards either Dove or Glow & Lovely. For this research to work, participants need some prior knowledge of the brand's previous messaging so they can determine whether this advertisement falls under authenticity or performance. Self-reported bias may occur when participants answer the questionnaire in ways they think are socially desirable rather than reflecting their own perceptions.

Appendix A: - AI declaration:**Research Problem: -**

Since English is not my first language, I used Artificial Intelligence to refine my writing and convert it from a conversational style to a more academic tone. All ideas and examples are my own. The research topic came from my interest in watching social advertisements during my undergraduate and postgraduate studies. The prompts that were specifically used were, "I want to do something on purpose-driven marketing but not just its effect on consumer trust since that's probably overdone. What keywords should I search?" After doing some research and thinking it through, this research problem came forward. AI helped me to put my idea into a formal research problem through wording.

The AI tools used are Claude and QuillBot. I started to use AI tools in late March. In the introduction, AI was used only to refine my writing and brainstorm ideas. Some of the prompts that were used were: "Refine this paragraph and make it a bit academic, don't change my idea and style." Another example of the prompt is, "Is this a good start to the paragraph, or should I first define the concept?"

Literature Review:

All the examples used in this section were from my own knowledge. AI was used for refinement to discuss the structure and flow of transitions between themes. All research papers were taken from the QMUL library and Google Scholar. AI helped put my ideas into words, specifically when I was trying to understand how consumers can tell which advertisements are authentic and which are performative. One of the prompts that was used is "I know that consistency is determinant of whether it is performative or authentic, like for example, Fair & Lovely suddenly changing its name and brand messaging, but not the formula, does this make sense?"

Research Design & Methodology: -

AI was mainly used for discussion and refinement. I discussed my experiment to make sure it do able or not. The videos were already decided by me; I was just trying to figure out how to record the response, whether it should be a focus group or a survey. Over here, one of the prompts used was: “So I have already decided my methodology method, but I don’t know what it is actually called, is it like a mixed approach or like a controlled experiment?”

Presentation & Syntax: -

For grammar, Grammarly was used, and QuillBot was used to paraphrase some sentences to improve flow and make the writing more academic. These were accessed in the second week of April, when most of the work was done. On the other hand, Grammarly was used to check if I had misplaced a comma or forgotten to add it where it was required.

Appendix B Advertisements utilized for controlled experiment: -

Advertisement shown to group A: Dove “Stop the beauty test.”

Video Link: -

Appendix C Questionnaire: -

Before the questionnaire officially starts consent will be taken and to inform participants that the brands that are used are purely for research purposes:

Consent

★ ...

Thank you for taking the time to participate in this study. Your input is truly appreciated. In this survey, you will be shown an advertisement and asked to share your thoughts and perceptions. There are no right or wrong answers; we are simply interested in your honest opinions. Please note: This study is conducted purely for academic purposes. The advertisements used in this survey have been selected solely as research stimuli to examine consumer perceptions. The researcher holds no bias against any brand featured, and the inclusion of any brand does not imply criticism or endorsement of that brand in any way. Your responses will remain completely anonymous and will only be used for academic purposes. By selecting "Yes" and continuing, you confirm you are 18 or older and happy to take part in this study.

☐ Yes, I consent☐ No, I do not consent

Scale: -

Consumer Trust: (Chaudhuri and Holbrook, 2001)

Q1

To what extent do you trust this brand to deliver on its promises?
